

ABSTRACT OF THE DISCLOSURE

A personal identification method and system for improving personal hygiene in which provision is made for identifying a beverage, food product, or the like, with a particular person so that another person does not inadvertently access the identified item unintentionally. Identifying indicia such as numbers or alphabetical letters are selectable and conditioned by the user to be prominently displayed on the item so as to identify it with the individual involved. For necked beverage containers, in one embodiment, a re-usable snap-on display device, or assembly, is configured to snap onto the neck of the container; in another embodiment, the existing conventional cap-attaching ring is modified to include alpha-numeric indicia and/or to receive a cooperating indicia-indicating display element. For beverage cans, a wand-like element portraying selectable alpha-numeric indicia is attached to the conventional snap ring opener; and for boxed beverages, a plurality of selectable identifying apertures are provided so that the user can personally distinguish his or her beverage from those of others.
